Summary

- Today i worked on the RE challenge I was working on with my professor from VCU. This was suppose to be a more advanced version I was to solve in my free time.
- This challenge had me learn a lot more about programming and problem solving. I had to figure out and learn that I need to pay more attention to what a program was compiled with. In most challenges I did not have to worry about this but I made the mistake of not taking note in this challenge.
- I also used python to go and automate the process. This was a big step for me as I chose to work at automating vs brute forcing.
- I will be uploading a more detailed write up as well as the one for the ctf soon.
